BEFORE YOU ARRIVE

Pre-Workshop Setup

Build Your AI Project Manager · ~20–30 min · do it on home/office wifi, not at the venue

The session is 2 hours and goes straight into code — there is no time to install things on the day. Please arrive with the steps below done and verified.

THE ONE THING THAT CAN'T BE RUSHED

Install Ollama and run `ollama pull llama3.1` (~4.7 GB). This download will NOT finish on shared venue wifi — do it beforehand.

Install & verify (tick each one)

☐ A laptop you can install software on — 8 GB RAM minimum, 16 GB recommended; admin rights. Apple Silicon or a discrete GPU runs the models much faster.

☐ Install Ollama from ollama.com (macOS / Windows / Linux)

☐ Pull the model: `ollama pull llama3.1` (weak laptop? also: `ollama pull llama3.2:3b`)

☐ Verify it runs: `ollama run llama3.1 "reply with one word: ready"` → you get a reply

☐ Python 3.10+: `python --version`

☐ Create a venv + install the framework: `pip install crewai crewai-tools pydantic` (inside an active venv)

☐ Download the code bundle (pm_crew.py, virtual_office.py, brief.md, requirements.txt) into one folder

☐ Recommended smoke test: `python pm_crew.py --brief brief.md` → if it produces output, you're fully ready

Bring on the day

- Laptop + charger (running models locally drains the battery fast).
- A code editor (VS Code or your preference).
- Optional: a real project brief of your own to point the assistant at.

Tell the organizer ahead of time if...

- You don't have admin rights to install software on your laptop.
- Your laptop has under 8 GB RAM or is quite old — we'll pair you up or run a driven setup.

If you only do one thing: install Ollama and pull llama3.1. Everything else takes a few minutes on the day; that download does not.
